Active evidence: FPTCranes-PR32-main

4. Model comparison and temporal validation

Frozen candidates · identical chronological DEV folds · lower MAE is better

Report question

Which frozen candidate performs best on chronological DEV validation, and how stable is that result?

Current takeaway: Random Forest has the lowest mean temporal-validation MAE at \$15,662.

Evidence: 5 candidates across 5 temporal folds · ui-c084f39b58453b1a

Main limitation: This ranks frozen candidate configurations on DEV folds; it does not replace the saved-model identity or prove a causal fit diagnosis.

Candidates 5

Temporal folds 5

Lowest CV MAE Random Forest

Best mean CV MAE \$15,662

Dummy reference \$54,011

Supplemental evidence ui-c084f39b58453b1a . Candidate CV rank does not replace the saved selected model.

> Priority guide: How temporal validation works

Overall comparison Random Forest Gradient Boosting Baseline controls

Question: Does Gradient Boosting match Random Forest across the same validation folds?

Frozen candidates across identical folds

Gradient Boosting temporal conclusion

Finding: Fold 4 (2026-01..2026-02) is the weakest Gradient Boosting period at \$20,577 validation MAE.

Why it matters: Validation MAE spans \$7,626 across the recorded folds, so performance is not temporally uniform.

Limit: Fold variation is descriptive and does not identify the economic or modeling cause.

Decision/use: Review the weakest period before relying on the mean alone.

Model	Validation MedAE (USD)
Random Forest	
Gradient Boosting	

The chart compares recorded errors; it does not establish a single causal reason for either model's rank.
