Saved full model · frozen-configuration CV · historically scored test evidence

Report question

How does the saved full model generalize from temporal DEV validation to the historically scored test period?

Current takeaway: Test MAE decreased by \$156 versus final-configuration DEV CV.

Evidence: Final full configuration · 298 Test rows · ui-4ee3de59fabafb88

Main limitation: R^2 decreased by 0.025; the Test was already exposed to scoring and is not pristine.

> How to read these metrics

Generalization **Residual diagnostics** Tuning Feature reliance Trust and audit

Question: Where do historical predictions depart from actual salaries, and are errors concentrated in a tail?

Test: actual vs predicted

Residual diagnostic conclusion

Finding: The median Test residual (actual – predicted) is \$-287 across 298 rows.

Why it matters: Residual sign shows the typical direction of error, while the scatter shows how errors vary across salary levels.

Limit: A centered median or visual pattern does not prove unbiasedness, no overfitting or future stability.

Decision/use: Inspect the residual distribution and tail metrics together rather than relying on one center statistic.

📷 🔍 + − 🏠 🔄

Test residual distribution

Scatter alignment and residual shape are diagnostics; neither proves unbiasedness, no overfitting, or future-market validity.
