Saved full model · frozen-configuration CV · historically scored test evidence

Report question

How does the saved full model generalize from temporal DEV validation to the historically scored test period?

Current takeaway: Test MAE decreased by \$156 versus final-configuration DEV CV.

Evidence: Final full configuration · 298 Test rows · ui-4ee3de59fabafb88

Main limitation: R² decreased by 0.025; the Test was already exposed to scoring and is not pristine.

Fixed full vs Top-2 feature comparison

Feature set	Evaluation	Rows	MAE (USD)	RMSE (USD)	R ²	MedAE
full	dev_cv_mean	1201	\$15033	\$26317	0.828	
top2	dev_cv_mean	1201	\$13923	\$25249	0.839	
full	historical_test	298	\$14877	\$29829	0.803	
top2	historical_test	298	\$13873	\$28480	0.821	

Feature-set conclusion

Finding: Top-2 Test MAE is \$1,004 lower than the full model on 298 matched rows.

Why it matters: The comparison isolates the fixed feature-set change on the same historical population.

Limit: Top-2 reused frozen full-model settings and was not independently tuned or promoted from test results.

Decision/use: Use Top-2 for the controlled two-input scenario UI; do not infer causal feature sufficiency.

Importance and feature ablation describe this fitted dataset/model. They are not causal wage effects, fairness evidence, or proof of production fitness.
